Summary

Software Developer and Full Stack Engineer building scalable SaaS platforms, backend services, automation engines, and real-time products. Strong in TypeScript, Python, Go, Node.js, FastAPI, PostgreSQL, Redis, cloud deployments, CI/CD, distributed systems, and production-grade API design.

Education

KIIT University, Bhubaneswar
B.Tech in Computer Science and Engineering; CGPA: 8.67 / 10

Bhubaneswar, India
Aug 2022 – Apr 2026

Skills Summary

- **Languages:** TypeScript, JavaScript, Python, Go, Java, SQL, C++, HTML/CSS
- **Frontend:** Next.js, React, responsive UI, dashboard development, OAuth flows, API integrations
- **Backend:** Node.js, Express.js, FastAPI, Flask, REST APIs, multi-tenant systems, queues, caching, WebRTC
- **Databases & Infra:** PostgreSQL, MySQL, MongoDB, Redis, Pinecone, FAISS, Apache Kafka, Pub/Sub, Event-Driven Systems
- **Cloud & DevOps:** Azure, AWS, GCP, Docker, Kubernetes, GitHub Actions, Jenkins, Maven, CI/CD

Experience

Dyyota Tech (CodePup AI)
AI/ML Full Stack Engineer Intern

Bengaluru, India
Jun 2025 – Present

- **Modification Engine:** Built a minimal-change pipeline using **diff/patch, grep, and AST transforms** to apply small edits in **two LLM calls**, reducing token usage for targeted frontend and code updates.
- **Preview Infrastructure:** Designed container preview infra across **five Azure Container App environments** and a load balancer after quota limits, enabling preview capacity for **up to 5,000 generated websites** simultaneously.
- **Build-Fix Agent:** Built automated build/runtime recovery using Playwright route scans, Azure Functions callbacks, Supabase error logs, and screenshots so the agent could diagnose and fix broken websites after generation.
- **Multi-Agent Orchestration:** Implemented orchestrator, DB, modification, and integration-agent pipelines plus an **Ng-inx authenticated routing layer** to handle file upload, build, screenshot, and preview actions through a single exposed container port.

Akatsuki AI Technologies / アカツキAIテクノロジーズ
Full Stack Engineer Intern

Remote
Jan 2026 – Feb 2026

- **Platform Foundation:** Initialized the **FastAPI + Docker + Redis** codebase, multi-tenant schema, NeonDB wiring, ingestion pipeline, and request/response API layer.
- **Core Systems:** Built **JWT auth**, Gemini-backed analysis flows, HTML email generation, recipient management, and multi-recipient delivery tracking.
- **Frontend and Ops:** Shipped the complete **React + TypeScript + Vite + Tailwind** frontend, Cloud Scheduler / OIDC jobs, Cloud Build CI/CD, and deployment scripts.
- **Execution:** Merged **23 PRs** and contributed **113 commits** across backend, frontend, infra, and production fixes.

Projects

CodePup.ai
Tech: TypeScript, Azure, Docker, PostgreSQL, Supabase, Playwright

- **AI Website Builder:** Built a multi-tenant platform for generating, previewing, and modifying websites from prompts with authentication, deployment flow, and tenant-aware project state.
- **Product Workflow:** Added natural-language modification flows, preview lifecycle management, project persistence, and tooling for repeated website iteration.
- **Platform Reliability:** Structured backend APIs, validation, background jobs, and preview handling so generated sites could be reviewed and refined end-to-end.

Multimodal RAG System
Tech: Python, Azure OpenAI, Pinecone, LangChain, LangSmith, Qwen-VL

- **Multisource Retrieval:** Built a RAG system across PDFs, websites, tabular files, and images using **Qwen-VL**, Azure OpenAI, Pinecone, and LangChain orchestration.
- **Query Routing:** Implemented source routing and query decomposition into **2–4 focused sub-queries** to improve retrieval coverage and answer depth.
- **Evaluation:** Added LangSmith tracing and retrieval-quality checks, reaching **95% retrieval accuracy**.

Outreach Engine
Tech: Next.js, TypeScript, Clerk, Inngest, Apify, Apollo, Perplexity

- **Lead Setup Flow:** Built a **3–4 click outbound workflow** with Clerk auth where users submit a website, trigger crawler/sitemap analysis, enrich context with Perplexity, and lock the final ICP.
- **Inngest Orchestration:** Used **Inngest** to coordinate company discovery via Apify + Perplexity, then scored leads with LangChain agents using **Claude Haiku on Amazon Bedrock**; only companies above threshold moved forward.
- **Email + Campaign Engine:** Automated email discovery and verification with Apify, Apollo, Perplexity, and other tools, then generated personalized campaigns, follow-ups, and link-triggered outreach sequences for final user review.
